

than a critical level that would affect reproductive success. Further reductions in shell thickness, however, would pose a threat to the continued survival of the species, which is restricted in its breeding range to central and southern California and north-west Baja California (A.O.U. 1957).

Research was supported by the National Science Foundation Grant GB-11649 to the Institute of Marine Resources, University of California, H. S. Olcott, Principal Investigator. We thank the United States Coast Guard for its assistance.
