

FIELD OBSERVATIONS

Winter report: December 2000-February 2001.—This report consists of significant observations of birds reported to the Field Observations Committee (FOC) or “plucked” from Internet lists. Submissions should be in the following format: species, number of individuals, age and sex of the bird(s), color morph if applicable, location (including county), date, observer(s), and significance. Seasons are winter (December-February), spring (March-May), summer (June-July), and fall (August-November). Submit observations to regional compilers within two weeks after the close of each season, or to the state compiler within one month. We greatly prefer observations sent via e-mail. Addresses of the FOC members are found at the end of this report.

Sight-only observations are considered “reports” while only those supported by verifiable evidence (photographs, video or audio tapes, or specimens) are called “records.” Species for which documentation is required by the FOS Records Committee (FOSRC; Bowman 2000, *Fla. Field Nat.* 28: 149-160) are marked with an asterisk (*). A county designation (*in italics*) accompanies the first-time listing of each site in this report. Abbreviations used are: CP = county park ENP = Everglades National Park, EOS = end of season, LARA = Lake Apopka Restoration Area (*Orange* unless noted), NWR = national wildlife refuge, PPM = *Polk* phosphate mines, SP = state park, SRA = state recreation area, STF = sewage treatment facility, and N, S, E, W, etc., for compass directions. Bold-faced species denote birds newly reported or verified in Florida, or record counts.

SUMMARY OF THE WINTER SEASON

Bob Duncan reported the “astonishing” total of **57** hummingbirds banded in *Escambia*, *Okaloosa*, *Santa Rosa*, and *Walton* this winter, composed of 30 Rufous, 12 Black-chinned, 11 Ruby-throated, 2 Calliope, 1 Buff-bellied, and 1 Broad-tailed. In *Franklin*, *Leon*, and *Wakulla*, the composition of 20 hummingbirds was 13 Rufous, 4 Ruby-throated, 1 Black-chinned, 1 *Archilochus* spp., and 1 *Selasphorus* spp. In southeastern Florida, John Boyd reported “a very good winter,” with numerous wood-warblers, sparrows, and western species observed.

Twenty-one (!) FOSRC review species were reported this winter. These were 2 Red-necked Grebes, 2 Western Grebes, 3 White-faced Ibises, a possibly “pure” Scarlet Ibis (of questionable origin), Ross’s Goose, Zone-tailed Hawk, the Heermann’s Gull, Elegant Tern, Calliope Hummingbird, Broad-tailed Hummingbird, Cuban Pewee, 2 or more Tropical-Couch’s kingbirds, 2 Cassin’s Kingbirds, Warbling Vireo, MacGillivray’s Warbler, Yellow-faced Grassquit, Cuban Grassquit (of questionable origin), Lark Bunting, 8 Lapland Longspurs, Chestnut-collared Longspur, and 5 Bullock’s Orioles. Other noteworthy sightings were an unprecedented flight of Red-throated Loons in northeast Florida, further indications of dispersal of Purple Swampheens from Pembroke Pines, 27 species of wood-warblers reported statewide, including 20 species in Everglades National Park on 21 Jan 2001, the continued “invasion” of Wilson’s Warblers, and impressive numbers of *Ammodramus* sparrows in the Peninsula. This winter, Harry Robinson surpassed 250 surveys of the eastern 3200-ha of Lake Apopka Restoration Area. Since 15 Aug 1998, he has observed **290** species of birds at the Restoration Area!

With the Fall 2000 report, Rex Rowan and Ron Smith have “retired” from the FOC. Bev Hansen has taken over responsibility of the Crystal River-to-Gainesville region, while David Powell will compile reports from the St. Petersburg/Tampa region. We have also added Bruce Anderson to the Committee; Bruce will compile reports from the Or-

lando-Titusville areas. We welcome Bev, Bruce, and David to the Field Observations Committee, and thank Rex and Ron for their excellent work.

Continuing a trend evident in recent years, this report is the largest winter report produced by the FOC, exceeding the previous largest (Winter 1999-2000) by over 800 words. One of the culprits is the huge volume of observations posted to any of several Internet lists in Florida. Now that all the Florida regional editors of *North American Birds* are members of the FOC, it is anticipated that efforts to largely eliminate the use of Internet postings in formally prepared bird reports will be increasingly successful.

Correction: Red-heads are More Faithful

In Shane Belson's note "Simultaneous use of snag by three breeding birds in central Florida" (Florida Field Naturalist 28:115-117, 2000), a major point of the note was missed due to a typographical error. On page 117, Belson intended to stress that Red-headed Woodpeckers are highly territorial and that at Wekiva Springs State Park he had observed marked males that occupied individual snags year round for three or more years.—Ed.
