

Parkhill records it as nesting in Cornwall, Vermont. On the 4th of June, 1891, my brother observed two of these birds haunting an old field in the town of Franconia, New Hampshire. The number was afterwards augmented by what were doubtless the second-brood young. He saw them near the same spot as late as the 21st of July. Mr. J. B. Grimes, an intelligent observer of birds in North Adams, Massachusetts, informs me that the Prairie Horned Lark breeds in North Adams and Williamstown at the base of the Saddleback Mountain range and he has shown me two specimens killed there the last of March, 1890, and the 13th of April, 1891—the breeding season of the bird in this latitude.—WALTER FAXON, *Museum of Comparative Zoölogy, Cambridge, Mass.*

**The Prairie Horned Lark in Northeastern Pennsylvania.**—I shot a typical specimen of *Otocoris alpestris praticola*, June 12, 1891, at Athens, Bradford Co., Pennsylvania. Another of the same species accompanied it. Mr. W. K. Park had informed me that a few were to be found every summer in the vicinity, and that he thought he could show me some. He was as good as his word, and the breeding range of this species in Pennsylvania must now be extended much further eastward than the character of the country would indicate.—JONATHAN DWIGHT, JR., *New York City.*

**A Correction.**—In my paper on *Molothrus* (Auk, 1891, p. 344) an unfortunate printer's error in the key to the species is liable to perplex anyone using it in the determination of specimens. *M. cabanisii* is there placed under the division 'B,' while it should be placed under division 'A' as a third subdivision, and should bear the heading, 'c' instead of 'b' as printed.—WITMER STONE, *Academy of Natural Sciences, Philadelphia.*

**Some Bird Notes from Litchfield, Connecticut.**—*Strix pratincola.*—On the 28th of August, 1891, a Barn Owl was shot while flying over a small pond near the village, at dusk. This is a rare bird in Connecticut, and it is apparently the first record for this part of the State. It is now in my collection.

*Turdus aonalaschkæ pallasii.*—I have recorded, on July 2, two birds flying along the Bantam,—a good-sized brook near the village,—one of which on being shot proved to be a young Hermit Thrush in the speckled plumage. The date and markings suggest the probability that it was one of a brood reared in the neighborhood.

*Cistothorus stellaris.*—The occurrence in this locality of this species, breeding seems also worthy of note.

*Geothlypis agilis* was present in unusually large numbers between September 18 and October 5. I have no record of it for this part of the State prior to this fall, but between the above dates I met with from one to four almost daily, which numbers, considering the extreme shyness manifested by them, would indicate comparative abundance.—LEWIS B. WOODRUFF, *New York City.*
