

country of Rhode Island. This year, however, at least one male has been heard singing upon the 28th and 29th of June, and the 1st and 2d of July in precisely the same neighborhood where he was heard and seen, as previously recorded. The song this year was a rather faint-hearted imitation of the Cardinal's fine call. By that I mean, that it was not uttered with the boldness observed in previous years. This may have been due to the great heat or some other cause, but there is no question it is the voice of the Great Carolina Wren upon the dates given this year.

I send this note to 'The Auk,' hoping that some other observer may feel prompted to record his observation, as it is certainly a matter of interest to Rhode Islanders to find this delightful bird becoming a fairly regular summer visitor.—R. G. HAZARD, *Peacedale, R. I., July 4, 1907.*

Large Set of Brown-headed Nuthatch's Eggs.—On March 17, 1907, I took a set of eggs that perhaps is worth mentioning. While out riding I saw a Brown-headed Nuthatch (*Sitta pusilla*) fly from a hole in a pine stump (about 6 feet up). Riding up to it I broke a piece of the wood away and peeped in. To my surprise, the nest contained nine eggs. I took the nest and eggs and now have them. Incubation was slight. The eggs are rather under the average in size and very uniformly marked. I have never seen a set of more than six eggs before and have found sets of that number rather rare. The usual set here is five eggs, while often it is four and sometimes only three. The earliest set I have ever taken was a set of six fresh eggs on March 3, while the latest was a set of five slightly incubated on April 22.—I. F. ARNOW, *St. Marys, Ga.*

A Recent Blue-gray Gnatcatcher (*Poliophtila caerulea*) in Delaware Co., Pa.—On May 18 while out birding near Wayne, Pa., I was surprised to see a Blue-gray Gnatcatcher above me. I was more than pleased to see it on account of its rareness in this locality and also the first one I had ever seen. I followed and watched it at close range with fairly strong glasses and feel very sure of its identity. The long black tail with white edges and the whole appearance of the bird were unmistakable.—LEONARD S. PEARSON, *Wayne, Pa.*

Two Birds new for Ohio (*Oceanites oceanicus* and *Merula migratoria achrostrera*).—During a recent visit to New Bremen, Anglaize Co., Ohio, Mr. Gus Kuenning, a banker and close observer of birds, told me about the occurrence of Wilson's Petrel at this place. On July 7 of this year, he found the partly decomposed body of a bird, which had been washed off the roof of St. Paul's church by a severe rainstorm. He identified the bird and upon cross-examining him I found that he knew very well what he was talking about and that his identification was correct. How long the body had lain on the roof could not be told and it was also too far gone to be preserved. It was probably killed by striking against the church tower. This is the second species of these wanderers that has been found in the State of Ohio.
