damental layer in both cases is colored with oöcyanin. This gives some idea of the thorough study of the shell structure and coloration that Mr. Lechner has conducted, a line of investigation which has been utterly neglected by American 'oölogists' but one well worthy of pursuit if they would substantiate the claim that their large series of egg shells are collected for the benefit of 'science.' One can readily appreciate how such investigations may yield data of much phylogenetic value. We congratulate Mr. Lechner upon the character of his work and upon its progress towards completion, while the publisher deserves the highest credit for a beautiful piece of book-making.— W. S.

Phillips on African birds.— Drs. J. C. Phillips and G. M. Allen spent two months beginning December 25, 1912, on the Blue-Nile and Dinder River, in Sennar, Sudan, and obtained a collection of 340 birds, representing 150 species. A briefly annotated list of these is published by Dr. Phillips in the Bulletin of the Museum of Comparative Zoölogy, with a short account of the trip. Descriptions of two new forms, Caprimulgus eleanoræ and Passer domesticus chephreni were described previously, while in the present number of 'The Auk' appears an article on the author's impressions of the bird life of the Sudan and a color plate of the new Nightjar.

Dr. Phillips found the mid-winter bird-life, especially at the mountain at Fazogli, far less rich and varied than has been reported by summer visitors and evidently, as he points out, there must be considerable local seasonal movements among the resident species.— W. S.

Bunker on the Birds of Kansas.— During the years 1911 and 1912, Messrs. C. D. Bunker and T. A. Rockland made extensive explorations along the south, west and north borders of Kansas, collecting about 1700 skins in forty-one different counties. Meanwhile, Miss Arta Briggs has carefully reidentified the collection of birds in the University of Kansas Museum and brought the nomenclature up to date. Eight forms new to the state list were obtained on the field trips, while Miss Briggs has detected twenty-seven species and subspecies not contained in Prof. Snow's last edition of this 'List of the Birds of Kansas,' published in 1903. These have been incorporated in the new list of Kansas birds which Mr. Bunker, assisted by Miss Briggs and Mr. Dix Teachenor, here presents and which has been brought up to date in matters of nomenclature though primarily
