

Tanager for the coast of this State. I replied about six or seven, whereupon she said that there was a bird in a large myrtle bush a short distance away, that she thought was a Scarlet Tanager, as the red color was very different from that of the Cardinal, and that she could see black on the wings. I knew that she was familiar with the species, as she has seen it in the North Carolina mountains.

Naturally investigation promptly followed, and the bird was plainly seen in a few moments by Mr. Chamberlain, as it left the myrtle bush and alighted on a wire fence close by, where he shot it. It is a beautiful male in fine plumage, and was mounted for the museum collection. The distance from where the bird was shot to the ocean could not have been over five hundred yards.

Below are the dates on which the former specimens have been secured, all A. T. Wayne's records;

April 29, 1884, Oakley, S. C. Not taken.

April 30, 1889, Mt. Pleasant, S. C. Taken.

May 4, 1911, " " " "

May 1, 1912, " " " "

May 6, 1921, McPhersonville, S. C. "

May 1, 1919, Mt. Pleasant, S. C. Not taken.

May 11, 1923, Fairlawn, S. C. Taken

May 2, 1924, Mt. Pleasant, S. C. Taken.

In addition to these records there are three observations from city bird students, two from H. R. Sass, and one from Mrs. Robert Wilson. Last year, 1923, one was taken in Summerville by S. G. Ball on April 23.—ALEXANDER SPRUNT, JR., *Charleston Museum, Charleston, S. C.*

A Remarkable Cedar Waxwing (*Bombycilla cedrorum*).—On March 18, 1924, I took in my yard from a Pride of India tree a Cedar bird that has the outermost right rectrix pure satiny white of the same length as the other normal (11) black ones, being tipped with yellow also of the same length as the other eleven feathers. The fact that the single white feather is not entirely white throughout its length, but tipped with yellow as all the others seems to me to be unique in albinism.—ARTHUR T. WAYNE, *Mount Pleasant, S. C.*

Blackpoll Warbler in Denver, Colorado.—On May 24, 1924, I detected a single individual of this species (*Dendroica striata*) in Cheesman Park, Denver. This is one of the rarest of Colorado's Warblers, in fact it is so rare that it has never before, in more than thirty years, come under my notice in the State. So far as I am now able to determine this record seems to be the first for the species in Denver, and together with additions since made to the last publication of a Denver List (Wilson Bull., Sept., 1917) makes two hundred and seven species and subspecies recorded as occurring within the present corporate limits of the city.—W. H. BERGTOLD, *1159 Race St., Denver, Colo.*
