

the bird was discovered did not permit the taking of the specimen. I am familiar with the Mockingbird, because of residence in Texas, where the bird is abundant. Every possibility of it being an escaped cage bird has been carefully checked, and there is no reason to doubt that this is a bona fide record. This is probably the first recorded presence of the Mockingbird in the Upper Peninsula of Michigan, and perhaps the most northern record for Michigan or Wisconsin.

The Mockingbird is a rare summer visitant to southern Michigan, where it has been reported about twenty times in as many years. The northernmost record to date is that of Mr. Walter M. Wolfe, who observed one at Beulah, Benzie County, August 15, 1906. Barrows records this in his 'Michigan Bird Life' (1912). In Wisconsin, Kumlien and Holister give Jefferson as its northern limit (Birds of Wisconsin, 1903). The writer did not find it in Green Lake County, Wisconsin, 1902-1912. (Bull. Wis. Nat. History, 1915.)—JOHN N. LOWE, *Northern State Normal School, Marquette, Mich.*

**Bewick's Wren (*Thryomanes bewicki bewicki*) Wintering on the Coast of South Carolina.**—I procured on December 27, 1925, in a yard next to mine, a fine specimen of this elusive bird. When first seen it was near the tidal creek by a large number of poles and, as I had no gun with me, I hastened home to get one and upon returning to the place I finally located the bird in a palmetto tree where I secured it.

Of the six examples of this rare coastal bird that I have seen near Charleston since 1907, this is the only one I have taken, the others having eluded me.

The records, all of single birds seen in October and positively identified but not taken, are as follows:

October 16, 1907, October 13, 1922, October 28, 1922, October 11, 1923, October 6, 1925. The specimen taken December 27, 1925, would seem to show that this bird may winter sparingly on the coast in widely separated localities, but at best it is one of the rarest birds found actually on the coast.—ARTHUR T. WAYNE, *Mt. Pleasant, S. C.*

**Notes from Southwestern Michigan.**—*Cardinalis cardinalis cardinalis*.—CARDINAL.—A pair of these birds have bred near Three Oaks, Berrien Co., Michigan, since 1923. I believe that there are only about five previous records of its breeding in the state.

*Vermivora peregrina*. TENNESSEE WARBLER.—On July 12, 1923, at Duck Lake, Muskegon Co., I saw a Tennessee Warbler feeding a young Cowbird which was but recently out of the nest. This is the first known instance of this bird breeding in Michigan. On June 23, 1924, I saw another which might have been nesting.

*Seiurus aurocapillus*. OVENBIRD.—On April 8, 1924, I saw an Ovenbird near Three Oaks; this is an extremely early record for this locality.

*Thryothorus ludovicianus ludovicianus*. CAROLINA WREN.—On both
