

Barrier Reef of Australia is most interesting reading. There is a chapter on the history of the reef, which by the way covers some 80,000 square miles and is about 1500 miles in length, some account of its explorers, of the author's cruise about its islands and much about the marvels of the oceanic life that abounds there—corals, crabs, fish, turtles, etc.

To the ornithologist three chapters have an especial appeal although birds figure in many other parts of the volume. One of these treats of the Mutton Bird, or Wedge-tailed Shearwater, which digs its nests in the crumbly soil of the islands, arriving at night in swarms from the ocean, and departing at dawn. The vocal powers of this bird according to the author exceed those of any beast or bird that he has ever heard. "The Lyre-bird" he says "is regarded as our champion mimic but he can imitate only what he hears. The Mutton Bird on the other hand can mimic anything whatever whether he has heard it or not and does it for eight hours on end without a pause." The long burrows which the birds construct and the little paths down which they travel to the sea are interestingly described. Another chapter considers the Noddy Terns and Gannets and a third the Herons, Gulls and Terns which nest in large colonies on the reef islands.

Even though the author styles himself an "No-ologist" he presents much interesting information about the birds and other animals of which he writes while his keen sense of humor makes his accounts most attractive. This is a nature book well worth having.—W. S.

**Astley's 'From a Bird Lover's Diary.'**—Here is another charming description of English bird life.<sup>1</sup> The chapters were originally published in 'Parents' Review' and have now been put in book form with some slight revision but the author has been careful "not to destroy the atmosphere of personal observation which is the only thing about bird watching that matters."

There are chapters on the twelve months of the year with a typical bird for each as the central theme. The Golden-crested Wren for January, the Redstart for June, the Woodcock for October, etc. Other chapters treat of bird life of a northern lake, of a northern woodland, of a northern mountain; of flight, migration, song and nest habits, while many delightful photographs of rural England serve as illustrations.

Mr. Astley has been a life long bird watcher and all the observations here set forth are matters of personal experience. For him who would gain a clear picture of British bird life such a work as this, with its intimate studies, seems to us better than the systematic text book. To the host of "bird watchers" in America it should have a strong appeal.—W. S.
