Vol. XLVII 1930

We wish Dr. Friedmann all speed with the remainder of his task and the report on the birds of the Roosevelt Expedition which we understand is to follow, and feel that we can speak for all students of African ornithology in congratulating him upon an excellent piece of work,—W. S.

Hortling's 'Handbook of Finland Birds.'-Of this pretentious work,¹ entirely in the Finnish language, three parts have appeared, leaving the Shore-birds, Gulls, and other sea birds to be covered by another installment.

Under each species is a description of the male, female and young; a paragraph devoted to song and call notes, presented by the syllabic method, and others on nest and eggs, migration and extralimital races. There is also a list of the names given to the birds in the various languages of the countries in which they occur, with their origins.

Half-tone illustrations are scattered through the text some from photographs of the live birds but mainly from mounted specimens. The work is thoroughly up to date both in the manner of treatment and in nomenclature and is excellently printed.

It will form an admirable handbook for Finnish bird students as well as a work of reference for ornithologists in other lands.—W. S.

La Touche's 'Handbook of the Birds of Eastern China.'²—Part V of this important work is before us completing Volume I, the Passeres. It covers the Pipits, Larks, White-eyes, Sunbirds, Flower-peckers, Pittas and Broadbills. There follow eleven pages of "corrigenda and addenda" covering the five parts that have been published and an index.

This last part of the work fully maintains the high standard of its predecessors and the publication should long stand as our authority for the birds of the region it covers.—W. S.

Recent Papers by Chasen and Kloss.—Messrs. Chasen and Kloss have published a review of the puzzling genus of Malay Flycatchers, *Cyornis*⁴ in which for the most part they accept the treatment of Stressemann (Ornith. Monatsb., 1925, pp. 43–53) as far as it goes and amplify it with the aid of additional material. They recognize seven specific groups to which the various races are assigned. No new forms are proposed but a point well worthy of careful consideration in the fine discrimination of subspecies is emphazid, i. e. the post mortem change in color of the plumage of the under parts of these birds; freshly killed specimens being yellower and less rusty than older skins. Dr. Chapman has called attention to the

⁴ On some Birds of the Genus Cyornis. By F. N. Chasen and C. Boden Kloss. Bull. Raffles Mus. No. 2, July 1929. 23-42.
