*Department of Zoology, University of Manitoba, Winnipeg, Manitoba R3T 2N2, Canada*

Nolan (1978) reported the average laying time of Prairie Warblers (*Dendroica discolor*) relative to civil

twilight, instead of to sunrise (SR), as stated in McMaster et al. (1999). Because sunrise occurs approximately 30 min after civil twilight, the mean laying time of Prairie Warblers should read  $\bar{x} = SR + 4$  min.

We thank David M. Scott for pointing out our error.
