## Commentary on the 1980 Annual Report

Daniel M. Taylor

The total number of birds banded in the WBBA area in 1980 was 157,787, representing 407 species on the continent and 6,033 individuals, representing 53 species in Hawaii. Compared with 1979, this is a decrease of 19% for the total number banded and an 11% decrease for the total number of species, but is almost exactly the 10-year average for these 2 categories. In addition there were 2 hybrids: Red-shafted X Yellow-shafted Flicker (3) and Audubon's X Myrtle Warbler (37). All but 1 of the hybrid warblers were banded by Idaho Coop. WRU. This might have been the result of the location of their banding operations, but probably indicates that a closer scrutiny of this super-species by all banders would yield a larger proportion of hybrids. New species banded for the first time in the WBBA area were Cave Swallow (21) and Louisiana Waterthrush (1) in western North America, while Hawaii added Bush Warbler (3) and Orange-cheeked Waxbill (2).

Most areas of the WBBA showed moderate declines in numbers of banded birds compared with 1979, with Alaska's 50% drop especially noteworthy. Exceptions to this were (1) Arizona-New Mexico, which had a 76% increase from the previous year and its highest total since 1965; and (2) Yukon, B.C., and Alberta, with a 1980 total 118% higher than the 10-year average.

There were 282 active banders in 1980, 22 of which were sub-permittees. There were also 76 inactive banders reporting, for a total of 356 permittees responding to forms. This was a drop of 22% from 1979's number of active banders but an 18% increase over the 10-year average. There were 119 banders who ringed less than 100 birds in 1980, 42% of all those active. At the other end of the spectrum, 17 individuals banded more than 1000 birds. The average number of species per bander was 11.7, which was the lowest since at least 1965. The
