

"Common, especially in autumn. Some years the young are very common during the first 10 days of September." This species is so generally distributed that it must certainly occur at every station in its range. A little more careful and extended search will reveal it.

Dendroica striata (Forst.) BLACK-POLL WARBLER.

It thus appears that this species is somewhat restricted locally. Prof. Kumlein reports it as "very common in spring. A few undoubtedly nest in the state. Less plenty in September." Mr. David L. Savage has sent me the skin of a female taken May 20, 1894, with its nest and eggs, in Dallas Co., Iowa, by Fred Hamlin. This is the first state record of a nest.
