

The occurrence of this storm immediately before Thanksgiving day probably accounts for the large number of birds taken as local gunners were out in force during the holiday.

February 9, 1910.

ALFRED C. REDFIELD, *Wayne, Pa.*

NOTE ON THE NESTING OF BEWICK'S WREN.—In Dawson's Birds of Ohio, there is a photo of mine showing the nest and eight eggs of Bewick's Wren, built in an old coffee cup. This picture was taken on May 13, 1901, in Ross County, Ohio. The accompanying photo-

graph of nest and seven eggs of Bewick's Wren was built by the same pair of birds at the same place on April 28, 1902. Bewick's Wren in southern Ohio has two broods, and often three, the first having from seven to eleven eggs, the second generally from three to six. Nesting falls in late April and early May and again in June, and even July. In middle western Ohio it is a rather rare summer resident, and in northern Ohio a straggler only.

*New Bremen, O.*
