

**PUBLICATIONS REVIEWED****BIOLOGICAL SURVEY OF LAKE MAXINKUCKEE, IND., BY  
EVERMAN AND CLARK \***

Residents of the middle west, particularly those of Indiana, will find in this work a large fund of information on the fauna common to the region. That portion of the two volumes devoted to a list of the birds is relatively small, covering 100 of the 1170 pages and recording 175 species. The list has been presented in annotated form and no space has been consumed with descriptions, range, etc., which in the present case seems commendable. A considerable lot of original information is contained in the notes and where species are rare the author has given definite dates and records instead of indulging in generalities. This practice could well be followed by other authors since the day is past when we are content to take an author's statement, regarding an unusual species, that "it is still to be found," without giving supporting data. The water birds have been most partially noted, as might be expected, and the author has shown particular interest in the nidification of the summer residents. Professor Barton Warren Everman is the author of this section of the work.

Other chapters deal more or less exhaustively with the mammals, reptiles, amphibians, fish, mollusks, crustaceans, insects, etc., etc., and serve well to call our attention to the fact that there is much of interest in nature aside from ornithology. The Indiana Department of Conservation under the interested direction of Mr. Richard Lieber is to be commended for its part in getting this work "through the mill" and before the public.
