A Western Lark Sparrow from Florida.—While examining a series of Lark Sparrows (Chondestes grammacus) in the Louis Agassiz Fuertes Memorial Bird Collection at Cornell University, I came upon a specimen taken by Fuertes at Flamingo, Monroe County, Florida, on April 5, 1908. After comparing it with large series of both the western (C. g. strigatus) and the eastern (C. g. grammacus) subspecies at Cornell and at the University of Michigan Museum of Zoology, I have identified it as strigatus. McAtee, Burleigh, Lowery, and Stoddard (1944. Wils. Bull., 56:152–160) have pointed out the tendency of many western birds to migrate in an easterly or southeasterly direction. They list (Table 1, p. 156) the Western Lark Sparrow from Louisiana and Mississippi, but I have been unable to find this subspecies recorded from Florida.—Robert M. Mengel, University of Michigan, Ann Arbor.

Golden Eagles in Hidalgo, Mexico.—About mid morning on July 10, 1942, we saw one immature and two adult Golden Eagles (Aquila chrysaëtos) 10 miles north of Zimapan, Hidalgo. They sailed on set wings down the steep slopes of a mountain, crossed the Pan-American Highway a short distance ahead of our car, and continued over the valley until lost to sight. Although the Golden Eagle has been recorded from several localities in central Mexico, we have found no records from as far south as Hidalgo.—Robert M. Mengel, University of Michigan, Ann Arbor, and Dwain W. Warner, Minnesota Museum of Natural History, University of Minnesota, Minneapolis.
